Assignment: 3.2

Previous Feedback:

All items that were previously addressed in reference to the colors and the layout has been taken into account and all items are looking good!

Critique:

Users should be able to positively signal a piece of content:

I like what you have done in reference to your page content. The layout matches that of the style tile and it is of a unique stature.

Chosen Visual Framework:

The site is progressing very nicely. I was thinking about your site the other day and I thought of your logo being that of a bee and I thought that if you wanted to incorporate a texture to the page, you could use the honey comb texture for the body background to help bring out your individual baseball card effect. (This is only a suggestion). I know that using AngularJS it can be quirky at times and then when you integrate the Twitter Bootstrap it can be troublesome in the beginning. I know that I had some issues with it but I found this site to be helpful...

<http://getbootstrap.com/2.3.2/components.html>

This site has a lot of good information that is useful for everything from drop downs to navigation elements within the site. Hope that this helps.

Another site that I found that helps is the AngularJS site for developers with a emphasis on the API Docs...
<http://docs.angularjs.org/api>

I used this site to help me with my API; it might help you with your API.

My Notes:

It looks like all of your components are coming together nicely and I think that you have a good roll on your site. I think that it will be very useful for your users. I know that you had wanted to stay with your school colors but maybe utilize a cleaner style by taking the yellow and do like a stroke around the baseball

card of information with a white interior. I know that baseball cards always had a border around the outer edge that made them unique in there own right.

The black makes your elements stick out and it helps to bring the eye to the card of information. If you wanted to use the black, maybe change the opacity of it with the utilization of the honeycomb pattern underneath. Here is a cool way to do that effect to make your own honeycomb effect/texture...

So far you are doing great and you have made a lot of progress with your site. Good Job!
